THE TROPHIC CHARACTERISTICS OF THE GALL NEMATODE (K Trofischeeskol Kharakteristike Gallovoi Nematody) tr. by D. R. Eddy. [1962] [8]p. (foreign text included) 6 refs. [CSIRO] Trans. 5679. Order from OTS or SLA \$1.10 62-23718

Trans. of Zhurnal Obshchel Biologii (USSR) 1956, v. 17, no. 5, p. 396-399.

DESCRIPTORS: *Parasitic Infections, *Nematodes, *Meloidogyne, *Plants, Growth, Tissues (Biology).

Plants harboring the gall nematode, *Meloidogyne incognita*, react to the infection by increasing respiration and by activating respiratory enzymes in the regions of gall formation. The nematode liberates a proteolytic enzyme into the gall and feeds on the products of protein hydrolysis produced thereby. Gall formation is caused by toxic substances produced as a result of the action of the nematode on the plant tissues. These toxins may include certain amino acids.

*Metabolism, Oxygen consumption, Energy.

Data are reviewed showing that the qualitative characteristic of the active tissue remains constant not only in ontogeny, but in animals which are distant in their systematical positions. The ratio between active metabolism and the BMR in a given group of animals is one of the basic measures of evolutionary significance. The

62-23282

Trans. of Zhurnal Obshchel Biologii (USSR) 1959, v. 20,
no. 4, p. 299-307.

DESCRIPTORS: *Embryos, Lenses, Tissues (Biology),
*Antigens, Proteins, Biochemistry, *Crystalline lens.

A study of the process of antigen formation in the developing crystalline lens of the chick showed that establishment of its antigen structure is complete after seven days of incubation. During this period of development all the seven antigens characteristic of the definitive lens are formed. A very small amount of antigen of the definitive lens was found in the lens placode of the embryos in the 23-25 somite stage of development. (Biological Sciences-Physiology, TT, v. 8, no. 4)(over)
